**Note:**

- Immature Platelet Fraction (IPF) applicable in cases of Platelets less than 50,000 / cumm.
- Haemograms are reviewed and confirmed microscopically.

**Interpretation:**

Immature Platelet Fraction more than 10% indicates recovery of platelet count within 48 hours.

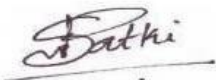

**Remark :** **Kindly correlate clinically.**

Test Name	Observed Value	ELISA REPORT		Method
		Unit	Biological Reference Interval	
<b>DENGUE NS1 BY ELISA *</b> Dengue NS1 Antigen (Serum)	Positive (32.92)	Panbio Units	Negative: <9 Equivocal: 9 - 11 Positive: >11	ELISA

**Interpretation :**

- Dengue virus is a flavivirus transmitted by mosquito, principally Aedes aegypti and Aedes albopictus.
- Primary dengue virus infection is characterized by elevations in specific NS1 antigen levels 0 to 9 days after the onset of symptoms; this generally persists upto 15 days.
- IgM antibodies are not detectable until 5 - 10 days in case of primary dengue infection and until 4-5 days in secondary infection after the onset of illness.
- IgG appear after 14 days and persist for life in case of primary infection and rise within 1-2 days after the onset of symptoms in secondary infection.

Negative	No detectable dengue NS1 antigen. The result does not rule out dengue infection. This sample should be tested by serology. If this sample is negative and dengue infection is still suspected, a follow up sample should be taken and tested, using serology, no later than 14 days after the initial sample was taken.
Equivocal	Equivocal samples should be repeated. Samples that remain equivocal after repeat testing should be repeated by an alternative method or another sample should be collected.
Positive	Presence of detectable dengue NS1 antigen. Dengue serology assays should be performed on follow-up samples to confirm dengue infection.
